

Abstract

Voice message notification and retrieval functionality is provided for a mobile client device in a communication system by generating push content deliverable from a server to the mobile client device over a wireless network. The push content comprises a notification of at least one voice message received for a corresponding user in a voice messaging system. A connection between the mobile client device and the voice messaging system may be initiated from the mobile client device, responsive to the push content, for retrieval of the at least one received voice message. For example, the push content may comprise at least one link which when activated at the mobile client device initiates a connection between the mobile client device and the voice messaging system.
